Abstract

We consider the weighted $A^p(\omega)$ and $B_p(\omega)$ spaces of holomorphic functions on the polydisk (in the case of $p > 1$). We prove some theorems about the boundedness of Toeplitz operators on weighted Besov spaces $B_p(\omega)$ and about the boundedness of generalized little Hankel and Berezin- type operators on $A^p(\omega)$.

1 Introduction and auxiliary constructions.

Let $U^n = \{z = (z_1, \dots, z_n) \in \mathbb{C}^n, |z_j| < 1, 1 \le j \le n\}$ be the unit polydisk in the n-dimensional complex plane $\mathbb{C}^n$ and let $T^n = \{z = (z_1, \dots, z_n) \in \mathbb{C}^n, |z_j| = 1, 1 \le j \le n\}$ be its torus. We denote by $H(U^n)$ the set of holomorphic functions on U^n, by $L^\infty(U^n)$ the set of bounded measurable functions on U^n and by $H^\infty(U^n)$ the set of bounded holomorphic functions in U^n.

Let S be the class of all non-negative measurable functions ω on $(0,1)$ for which there exist positive numbers M_ω, q_ω, m_ω $(m_\omega, q_\omega \in (0,1))$ such that

$$m_\omega \le \frac{\omega(\lambda r)}{\omega(r)} \le M_\omega$$

for all $r \in (0,1)$ and $\lambda \in [q_\omega, 1]$. Some properties of the functions in S can be found in [8]. We put

$$\alpha_\omega = \frac{\log m_\omega}{\log q_\omega^{-1}}; \qquad \beta_\omega = \frac{\log M_\omega}{\log q_\omega^{-1}}.$$

For example $\omega \in S$ if $\omega(t) = t^{\alpha}$ where $-1 < \alpha < \infty$. We always have

$$t^{\alpha_\omega} \leq \omega(t) \leq t^{-\beta_\omega},\ 0 < t < 1.$$

Below, for convenience of notations, for $\xi = (\xi_1, \ldots, \xi_n),\ z = (z_1, \ldots, z_n)$ we put

$$\omega(1-|z|) = \prod_{j=1}^{n} \omega_j(1-|z_j|), \quad 1-|z| = \prod_{j=1}^{n}(1-|z_j|), \quad 1-\bar{\xi}z = \prod_{j=1}^{n}(1-\bar{\xi}_j z_j).$$

Furthermore, for $m = (m_1, \ldots, m_n)$, we put $m+1 = \prod_{j=1}^{n}(m_j+1)$.

Definition 1. Let $1 < p < \infty$. We denote by $L_p(\omega)$ the set of all measurable functions on U^n for which

$$||f||^p_{L^p(\omega)} := \int_{U^n} |f(z)|^p \omega(1-|z|) dm_{2n}(z) < \infty,$$

where $dm_{2n}(z)$ is the $2n-$dimensional Lebesgue measure on U^n.

We set $A^p(\omega) = L^p(\omega) \cap H(U^n)$ and denote the restriction of $||\cdot||_{L^p(\omega)}$ to $A^p(\omega)$ by $||\cdot||_{A^p(\omega)}$. In particular, for $\alpha = (\alpha_1, ..., \alpha_n)$ if $\omega_j(t) = t^{\alpha}_j,\ \alpha_j > -1\ (1 \leq j \leq n)$ we set $A^p(\omega) \equiv A^p(\alpha)$.

Note that the spaces $A^p(\omega)$ are $\omega-$ weighted generalisations of $A^p(\alpha)$ considered by F.Shamoyan (see [2], [9]).

The following definition gives the notion of the fractional derivative.

Definition 2. (1) For a holomorphic function $f(z) = \sum_{(k)=(0)}^{(\infty)} a_k z^k,\ z \in U^n$ and for $\beta = (\beta_1, \ldots, \beta_n),\ \beta_j > -1,\ 1 \leq j \leq n$, we define the fractional derivative D^{β} as follows

$$D^{\beta} f(z) = \sum_{(k)=(0)}^{(\infty)} \prod_{j=1}^{n} \frac{\Gamma(\beta_j + 1 + k_j)}{\Gamma(\beta_j+1)\Gamma(k_j+1)} a_k z^k,$$

$k = (k_1, \ldots, k_n),\ z \in U^n$, where $\Gamma(\cdot)$ is the Gamma function and $\sum_{(k)=(0)}^{(\infty)} = \sum_{k_1=0}^{\infty} \cdots \sum_{k_n=0}^{\infty}$.

(2) Let $D^{-\beta}$ be the inverse operator, i.e. $D^{-\beta} D^{\beta} f(z) = f(z)$ for $z \in U^n$.

We put $Df(z) = D^{\beta} f(z)$ if $\beta = (1, \ldots, 1)$.

It is not difficult to show, that

$$f(z) = \int_0^1 Df(rz) dr \tag{1}$$

Next we define the holomorphic Besov spaces on the polydisk (see [3]).

Definition 3. Let $1 \leq p < \infty$ and $f \in H(U^n)$. The function is said to be in $B_p(\omega)$ if

$$||f||^p_{B_p(\omega)} = \int_{U^n} |Df(z)|^p \frac{\omega(1-|z|)}{(1-|z|^2)^{2-p}} dm_{2n}(z) < \infty.$$

We start by defining the Toeplitz operator on the spaces $H(U^n)$. Let $L^1(T^n)$ be the class of all integrable functions on T^n

Definition 4. The Toeplitz operator with symbol $h \in L^1(T^n)$ is the integral

$$T_h(f)(z) := \frac{1}{(2\pi i)^n} \int_{T^n} \frac{f(\xi)h(\xi)}{\xi - z} d\xi =$$

$$= \frac{1}{(2\pi i)^n} \int_{T^n} \frac{f(\xi_1, \ldots, \xi_n)h(\xi_1, \ldots, \xi_n)}{(\xi_1 - z_1)\ldots(\xi_n - z_n)} d\xi_1 \ldots d\xi_n, \quad f \in H(U^n).$$

Remark 1. *The above Toeplitz operator T_h can be extended to functions $f \in B_p(\omega)$ as follows: at first one can consider T_h on some everywhere dense subset of $B_p(\omega)$, for instance on the set of all polynomials where T_h is obviously well-defined. Then one can show that, if the operator T_h is bounded with respect to $||\cdot||_{B_p(\omega)}$ on the set of polynomials then it has a unique extension to $B_p(\omega)$ naturally denoted by T_h again.*

Our aim is to describe the symbols h, for which T_h defines a bounded operator $B_p(\omega) \to B_p(\omega)$. Some problems about the Toeplitz operators can be solved by means of Hankel operators and vice versa. In the classical theory of Hardy of holomorphic functions on the unit disk there is only one type of Hankel operator. In the $A^p(\alpha)$ theory they are two: little Hankel operators and big Hankel operators. The analogue of the Hankel operators of the Hardy theory here are little Hankel operators, which were investigated by many authors (see for example [5, 1, 10]). Let us define the little Hankel operators as follows: denote by $\overline{A}^p(\omega)$ the space of conjugate holomorphic functions on $A^p(\omega)$. For the integrable function f on U^n we define the generalized little Hankel operator with symbol $h \in L^\infty(U^n)$ by

$$h^\alpha_g(f)(z) = \overline{P}_\alpha(fg)(z) = \int_{U^n} \frac{(1-|\zeta|^2)^\alpha}{(1-\zeta\overline{z})^{\alpha+2}} f(\zeta)g(\zeta) dm_{2n}(\zeta),$$

$$\alpha = (\alpha_1, \ldots, \alpha_n),\ \alpha_j > -1,\ 1 \leq j \leq n.$$

The Berezin transform is the analogue of the Poisson transform in the $A^p(\alpha)$ theory. It plays an important role especially in the study of Hankel and Toeplitz operators. In particular, some properties of those operators (for example, compactness, boundedness) can be proved by means of the Berezin transform (see [10, 7]). The Berezin-type operators, on the other hand, are of independent interest.

Next we consider generalized Berezin-type operators on $A^p(\omega)$ if $p > 1$. It will be shown that some properties of Berezin-type operators of the one dimensional classical case also hold in our more general situation. For the integrable function f on U^n and for $g \in L^\infty(U^n)$ we define the Berezin-type operator in the following way

$$B_g^\alpha f(z) = \frac{(\alpha+1)}{\pi^n}(1-|z|^2)^{\alpha+2}\int_{U^n}\frac{(1-|\zeta|^2)^\alpha}{|1-z\overline{\zeta}|^{4+2\alpha}}f(\zeta)g(\zeta)dm_{2n}(\zeta).$$

In the case $\alpha = 0,\ g \equiv 1\ B_g^\alpha$ will be called the Berezin transform.

We need the following lemmas.

Lemma 1. *Suppose $f \in H^\infty(U^n)$ and $k = (k_1, \dots, k_n),\ k_j \in N,\ 1 \le j \le n$, then*

$$\left|\frac{\partial^{k_1+\dots+k_n} f(z)}{\partial z_1^{k_1}\dots\partial z_n^{k_n}}\right| \le \frac{Const}{\prod_{j=1}^n (1-|z_j|)^{k_j}}$$

Proof. Let $f \in H^\infty(U^n)$. We consider the polydisk

$$\widetilde{T}^n = \widetilde{T}_1 \dots \widetilde{T}_n, \quad \widetilde{T}_j = \left\{\zeta_j, \zeta_j = z_j + \eta_j(1-|z_j|)e^{i\theta_j}\right\} \quad j = 1, ..., n$$

We take η_j so that $\widetilde{T}_j$ lies in the unit disc. Using the Cauchy formula for $\widetilde{T}^n$ we get

$$\frac{\partial^{k_1+\dots+k_n} f(z)}{\partial z_1^{k_1}\dots\partial z_n^{k_n}} = \frac{1}{(2\pi i)^n}\int_{\widetilde{T}^n}\frac{f(\zeta_1,\dots\zeta_n)d\zeta_1\dots d\zeta_n}{\prod_{j=1}^n(\zeta_j - z_j)^{k_j}},$$

then

$$\begin{aligned}\left|\frac{\partial^{k_1+\dots+k_n} f(z)}{\partial z_1^{k_1}\dots\partial z_n^{k_n}}\right| &\le \frac{1}{(2\pi)^n}\int_{\widetilde{T}^n}\frac{|f(\zeta)|d\theta_1\dots d\theta_n}{\prod_{j=1}^n \eta_j(1-|z_j|^2)^{k_j}} \\ &\le Const\int_{\widetilde{T}^n}\frac{d\theta_1\dots d\theta_n}{\prod_{j=1}^n \eta_j(1-|z_j|^2)^{k_j}} = \frac{Const}{(1-|z_j|)^{k_j}}\end{aligned}$$

□

Lemma 2. *Let* $n=1,\ \omega\in S,\ a+1-\beta_\omega>0,\ b>1$ *and* $b-a-2>\alpha_\omega$. *Then*

$$\int_U \frac{(1-|w|^2)^a\omega(1-|w|^2)}{|1-z\overline{w}|^b}dm_2(w)\le\frac{\omega(1-|z|^2)}{(1-|z|^2)^{b-a-2}}$$

For proof see Lemma 1.6 [4]

2 Toeplitz operators on $B_p(\omega)$.

Theorem 1. *Let* $p>1,\ \beta_{\omega_j}<0,\ p\ge\alpha_{\omega_j},\beta_{\omega_j}+\alpha_{\omega_j}<0,\ 1\le j\le n$ *and* $h\in H^\infty(U^n)$. *Then* $T_{\overline{h}}$ *is bounded operator:* $B_p(\omega)\to B_p(\omega)$.

Proof. We show that, if $h\in B_q(\omega^*)$, then $T_{\bar h}(f)\in B_p(\omega)$. Using

$$f(z)=C(\alpha,\pi)\int_{U^n}\frac{(1-|\xi|^2)^\alpha Df(\xi)P(\bar\xi,z)}{(1-\bar\xi z)^{\alpha+1}}dm_{2n}(\xi).$$

where

$$P(\bar\xi,z)=(1-(1-\bar\xi z)^{\alpha+1})/z,\qquad \alpha=(\alpha_1,...,\alpha_n),\ \alpha_i\in\mathbb{N},$$

we get

$$T_{\bar h}(f)(z)=\frac{1}{(2\pi i)^n}\int_{U^n}(1-|\xi|^2)^m Df(\xi)\int_{T^n}\frac{\overline{h(t)}P(\bar t,\xi)dtdm_{2n}(\xi)}{(1-\bar\xi t)^{m+1}(t-z)}=$$
$$=\frac{1}{(2\pi i)^n}\int_{U^n}(1-|\xi|^2)^m Df(\xi)\overline{\int_{T^n}\frac{h(t)P(t,\bar\xi)t^m dt}{(1-t\bar z)(t-\xi)^{m+1}}dm_{2n}(\xi)}$$

Without loss of generality, we assume that $P(\bar t,\xi)=\bar t^l\xi^l$. Then we get

$$T_{\bar h}(f)(z)=\frac{1}{(2\pi i)^n}\int_{U^n}(1-|\xi|^2)^m Df(\xi)\int_{T^n}\frac{\overline{h(t)}t^l\xi^l\bar t^m dt}{(t-\xi)^{m+1}(1-\bar t z)}dm_{2n}(\xi)$$
$$=\frac{1}{(2\pi i)^n m!}\int_{U^n}(1-|\xi|^2)^m Df(\xi)\xi^l\frac{\partial^m}{\partial\xi^m}\overline{\left(\frac{h(\xi)\xi^{m-l}}{1-\xi\bar z}\right)}dm_{2n}(\xi)$$

We set $h(\xi)\xi^{m-l}=\tilde h(\xi)$. It follows that $\tilde h\in H^\infty(U^n)$ (we can take $m\in\mathbb{N}^n$.)

Then

$$T_{\bar h}(f)(z)=\frac{1}{(2\pi i)^n m!}\int_{U^n}(1-|\xi|^2)^m Df(\xi)\sum_{|k|=0}^{m}\xi^k C_m^k\frac{\partial^k\tilde h(\xi)}{\partial\xi_1^{k_1}\dots\partial\xi_n^{k_n}}\frac{dm_{2n}(\xi)}{(1-\bar\xi z)^{m-k+1}}.$$

Let

$$\Phi_k(z)=\int_{U^n}\frac{(1-|\xi|^2)^m Df(\xi)\xi^k}{(1-\bar{\xi}z)^{m-k}}\frac{\partial^{|k|}\tilde{h}(\xi)}{\partial\xi_1^{k_1}\dots\partial\xi_n^{k_n}}dm_{2n}(\xi).$$

We shall show that $\Phi_k(z)\in B_p(\omega)$. To this end using Lemma 1 we have

$$|D\Phi_k(z)|\le\int_{U^n}\frac{(1-|\xi|^2)^m}{|1-\bar{\xi}z|^{m-k+2}}\left|\frac{\partial^{k_1+\dots+k_n}\tilde{h}(\xi,\bar{\xi})}{\partial\xi_1^{k_1}\dots\partial\xi_n^{k_n}}\right||Df(\xi)|dm_{2n}(\xi)=$$

$$=\int_{U^n}\frac{(1-|\xi|^2)^{m-k}(1-|\xi|^2)^k}{|1-\bar{\xi}z|^{m-k+2}}\left|\frac{\partial^{|k|}\tilde{h}(\xi,\bar{\xi})}{\partial\xi_1^{k_1}\dots\partial\xi_n^{k_n}}\right|Df(\xi)|\le$$

$$\le C||\tilde{h}||_\infty\left(\int_{U^n}\frac{(1-|\xi|^2)^{(m-k+2/q)p}|Df(\xi)|^p dm_{2n}(\xi)}{|1-\bar{\xi}z|^{(m-k+2)p}}\right)^{1/p}$$

Then

$$\int_{U^n}(1-|z|^2)^p\frac{|D\Phi_k(z)|^p\omega(1-|z|)}{(1-|z|^2)^2}dm_{2n}(z)\le||h||_\infty\times$$

$$\times\int_{U^n}(1-|\xi|^2)^{(m-k+2/q)p}|Df(\xi)|^p\int_{U^n}\frac{(1-|z|^2)^p\omega(1-|\xi|)dm_{2n}(\xi)}{|1-\bar{\xi}z|^{(m-k+2)p}(1-|z|^2)^2}$$

We estimate the following integral in the one dimensional case

$$I(\xi)=\int_{U^n}\frac{(1-|\xi|^2)^{p-2}\omega(1-|\xi|)}{|1-\bar{\xi}z|^{(m-k+2)p}}dm_2(z).$$

(i) If $(m-k+2)p-1-p+2+\beta_\omega<1$ (hence $(m-k+1)p<-\beta_\omega$) then $I(\xi)\le const.$
(ii) If $(m-k+2)p>-\beta_\omega$ then $I(\xi)\le const./(1-|\xi|)^{(m-k+1)p+\beta_\omega-1}$.
(iii)If $(m-k+2)p=-\beta_\omega$ then $I(\xi)\le\log(1-|\xi|)^{-1}$.
For the case (i) we have

$$\int_U(1-|\xi|^2)^{(m-k+2/q)p}|Df(\xi)|^p\frac{\omega(1-|\xi|)}{\omega(1-|\xi|^2)}dm_2(\xi)\le$$

$$\int_U|Df(\xi)|^p\frac{\omega(1-|\xi|)}{(1-|\xi|^2)^{2-p}}(1-|\xi|)^\gamma dm_2(\xi)=\|f\|^p_{B_p(\omega)}$$

where $\gamma=p(m-k)+2p/q+2-p-\alpha_\omega=(m-k)p+p-\alpha_\omega\ge 0$.
For the case (ii) we have

$$\int_U(1-|\xi|^2)^{(m-k+2/q)p}|Df(\xi)|^p\frac{dm_2(\xi)}{(1-|\xi|)^{(m-k+2)p+\beta_\omega-1}}=$$

$$=\int_U|Df(\xi)|^p\frac{\omega(1-|\xi|)}{(1-|\xi|^2)^{2-p}}\frac{dm_2(\xi)}{(1-|\xi|^2)^{\beta_\omega+2p-2p/q-2}}\le C||f||^p_{B_p(\omega)},$$

if $\beta_\omega + 2p - 2p/q - 2 = \beta_\omega + \alpha_\omega < 0$.
(iii) let $(m-k+1)p = -\beta_\omega$. Then

$$\int_U (1-|\xi|^2)^{(m-k+2/q)p} |Df(\xi)|^p \frac{\omega(1-|\xi|)}{\omega(1-|\xi|^2)} \log\left(\frac{1}{1-|\xi|}\right) dm_2(\xi)$$
$$= \int_U |Df(\xi)|^p \frac{\omega(1-|\xi|)}{(1-|\xi|^2)^{2-p}} (1-|\xi|^2)^{-\beta_\omega - p + 2p/q - p + 2 - \alpha_\omega} \log\left(\frac{1}{1-|\xi|}\right) dm_2(\xi)$$
$$\leq C||f||^p_{B_p(\omega)},\ -\beta_\omega - \alpha_\omega > 0.$$

Then it follows that $\Phi_k \in B_p(\omega)$ and therefore $T_{\bar{h}}(f) \in B_p(\omega)$.

□

We turn to the application of our result to division theorem in spaces $B_p(\omega)$, $(p > 1)$. To this end, we need the following well-known definitions.

Definition 5. A function $g \in H^\infty(U^n)$ is called an inner function, if its radial boundary values satisfy $|g^*(w)| = 1$ almost everywhere on T^n (see [6]

Definition 6. An inner function $g \in H^\infty(U^n)$ is said to be good, if $u[g] = 0$, where $u[g]$ is the least n-harmonic majorant of $\log|g|$ in U^n .

Theorem 2. *Let $p > 1$, $\beta_{\omega_j} < 0$, $p \geq \alpha_{\omega_j}$,$\beta_{\omega_j} + \alpha_{\omega_j} < 0$, $1 \leq j \leq n$. Let $f \in B_p(\omega)$ and J be good inner function and $F = f/g \in H(U^n)$. Then $F \in B_p(\omega)$.*

Proof is ivident:

$$T_{\overline{J}}(f)(z) = \frac{1}{(2\pi i)^n} \int_{T^n} \frac{f(\zeta)\overline{J}(\zeta)}{\zeta - z} d\zeta =$$

$$= \frac{1}{(2\pi i)^n} \int_{T^n} \frac{f(\zeta)/\overline{J}(\zeta)}{\zeta - z} d\zeta = \frac{1}{(2\pi i)^n} \int_{T^n} \frac{F(\zeta)}{\zeta - z} d\zeta = F(z)$$

By Theorem 1 $F \in B_p(\omega)$

□

3 Hankel und Berezin type operators on $A^p(\omega)$

Theorem 3. *Let $p > 1$, $f \in A^p(\omega)$ (or $f \in \overline{A}^p(\omega)$), $g \in L^\infty(U^n)$. Then $h^\alpha_g(f) \in \overline{A}^p(\omega)$ if and only if $\alpha_j > (\alpha_{\omega_j} + 1)/p - 1$, $1 \leq j \leq n$.*

Proof. By Holders inequality,we have

$$\|h_g^\alpha f\|^p_{\overline{A}^p(\omega)} = \int_{U^n} \omega(1-|z|)\left(\int_{U^n} \frac{(1-|\zeta|^2)^\alpha}{|1-\overline{z}\zeta|^{\alpha+2}}|f(\zeta)||g(\zeta)|dm_{2n}(\zeta)\right)^p dm_{2n}(z) \leq$$

$$\leq C\int_{U^n} \frac{\omega(1-|z|)}{(1-|z|^2)^{\alpha p/q}} \int_{U^n} \frac{(1-|\zeta|^2)^{\alpha p}}{|1-\overline{z}\zeta|^{\alpha+2}}|f(\zeta)|^p|g(\zeta)|^p dm_{2n}(\zeta)dm_{2n}(z)$$

$$\leq C\int_{U^n}(1-|\xi|^2)^{\alpha p}|f(\zeta)|^p|g(\zeta)|^p \frac{\omega(1-|\zeta|)}{(1-|\zeta|^2)^{\alpha+\alpha p/q}}dm_{2n}(\zeta) = C\|g\|^p_\infty \|f\|^p_{A^p(\omega)}$$

In the last inequality we have used Lemma 2. Conversely, let $h_g^\alpha(f) \in \overline{A}^p(\omega)$ for all $g \in L^\infty(U^n)$. Take the function $f_r(\zeta)$ and $g_r(\zeta)$ as follows:

$$f_r(z) = C_r(1-rz)^{-k}, k_j > (\alpha_{\omega_j}+2)/p,\ 1 \leq j \leq n, r = (r_1,...,r_n) \qquad (2)$$

$$r_j \in (0,1),\ k = (k_1,...,k_n),\ C_r = (1-r)^{k-2/p}\omega^{-1/p}(1-r) \qquad (3)$$

and

$$g_r(\zeta) = \exp^{-\arg f_r(\zeta)} \qquad (4)$$

Then we have $\|f_r\|_{A^p(\omega)} \sim const.$
We consider the following domain

$$\widetilde{U}_j = \{z_j \in U, |\arg z_j| < (1-r_j)/2;\ (4r_j-1)/3 < |z_j| < (1+2r_j)/3\}$$

$$\widetilde{U}^n = \widetilde{U}_1 \times \ldots \times \widetilde{U}_n \qquad (5)$$

the domain $\widetilde{U}^n$ defined by (5) andc a polydisk V^n such that $\overline{V}^n \subset \widetilde{U}^n$($\overline{V}^n$ is the closure of V^n)i. Then we get

$$\|h^\alpha_{g_r} f_r\|_{\overline{A}^p(\omega)} \geq \int_{U^n} \omega(1-|z|)\left(\int_{V^n} \frac{(1-|\zeta|)^\alpha}{|1-\overline{z}\zeta|^{\alpha+2}}|f_r(\zeta)|dm_{2n}(\zeta)\right)^p dm_{2n}(z) = I.$$

Let

$$\max_{\zeta\in\overline{V}^n}|1-\overline{z}\zeta| = |1-\overline{z}\widetilde{\zeta}|,$$

then

$$I \geq C_1(\alpha,p,\omega)\frac{(1-r)^{\alpha p-2}}{\omega(1-r)}\int_{U^n}\omega(1-|z|)\left(\int_{V^n}\frac{dm_{2n}(\zeta)}{|1-\overline{z}\zeta|^{\alpha+2}}\right)^p dm_{2n}(z) \geq$$

$$C_1(\alpha,p,\omega)\frac{(1-r)^{(\alpha+2)p-2}}{\omega(1-r)}\int_{U^n}\frac{\omega(1-|z|)}{|1-\overline{z}\widetilde{\zeta}|^{(\alpha+2)p}}dm_{2n}(z).$$

If we assume that $(\alpha_j+2)p \le \alpha_{\omega_j}+2$ for some j, then for the corresponding integral taking $\omega_j(t) = t^{\alpha_{\omega_j}}$ we get

$$\int_U \frac{\omega_j(1-|z_j|)}{|1-\overline{z}\widetilde{\zeta}|^{(\alpha_j+2)p}} dm_2(z_j) \sim const, \quad \text{if} \quad (\alpha_j+2)p < \alpha_{\omega_j}+2$$

and

$$\int_U \frac{\omega_j(1-|z_j|)}{|1-\overline{z}\widetilde{\zeta}|^{(\alpha_j+2)p}} dm_2(z_j) \sim \log\frac{1}{1-|\widetilde{\zeta}_j|}, \quad \text{if} \quad (\alpha_j+2)p = \alpha_{\omega_j}+2.$$

Consequently,

$$\frac{(1-r_j)^{(\alpha_j+2)p}}{\omega_j(1-r_j)(1-r_j)^2} \to \infty, \quad \frac{(1-r_j)^{(\alpha_j+2)p}}{\omega_j(1-r_j)(1-r_j)^2}\log\frac{1}{1-r_j} \to \infty$$

if $r_j \to 1-0$.

□

Next we consider the boundedness of the Berezin-typ operators.

Theorem 4. *Let $p>1$, $f \in A^p(\omega)$ (or $f \in \overline{A}^p(\omega)$), $g \in L^\infty(U^n)$ and let $\alpha_j > (\alpha_{\omega_j}+1)/p - 1$, $1 \le j \le n$. Then $B_g^\alpha(f) \in L^p(\omega)$.*

Proof. Let $f \in A^p(\omega)$ or $f \in \overline{A}^p(\omega)$. We will show that $B_\alpha f \in L^p(\omega)$. To this end we estimate the corresponding integral

$$\int_{U^n} \omega(1-|z|)\left((1-|z|^2)^{\alpha+2}\int_{U^n}\frac{(1-|\zeta|^2)^\alpha|f(\zeta)|}{|1-z\overline{\zeta}|^{4+2\alpha}}dm_{2n}(\zeta)\right)^p dm_{2n}(z) \equiv I$$

By Holders inequality, we get

$$\left(\int_{U^n}\frac{(1-|\zeta|^2)^\alpha|f(\zeta)|}{|1-z\overline{\zeta}|^{4+2\alpha}}dm_{2n}(\zeta)\right)^p \le$$

$$\frac{\|g\|_\infty}{(1-|z|)^{(2+\alpha)p/q}}\int_{U^n}\frac{(1-|\zeta|^2)^\alpha|f(\zeta)|^p}{|1-\zeta\overline{z}|^{4+2\alpha}}dm_{2n}(\zeta)$$

Then we get

$$I \le \int_{U^n}\frac{\omega(1-|z|)(1-|z|)^{(\alpha+2)p}}{(1-|z|)^{(\alpha+2)p/q}}\int_{U^n}\frac{(1-|\zeta|^2)^\alpha|f(\zeta)|^p|g(\zeta)|^p}{|1-\zeta\overline{z}|^{4+2\alpha}}dm_{2n}(\zeta)dm_{2n}(z)$$

$$= \int_{U^n}|f(\zeta)g(\zeta)|^p(1-|\zeta|^2)^\alpha\int_{U^n}\frac{\omega(1-|z|)(1-|z|)^{(\alpha+2)(1-1/q)p}}{|1-\zeta\overline{z}|^{4+2\alpha}}dm_{2n}(z)dm_{2n}(\zeta) \le$$

$$\int_{U^n}|f(\zeta)g(\zeta)|^p\omega(1-|\zeta|)dm_{2n}\zeta \le \|f\|^p_{A^p(\omega)}\|g\|^p_\infty$$

We have used Lemma 2 again.
